
COOPER CLINIC NOW OFFERS GENETIC TESTING

Gain Valuable Insights into Your Health with Genetic Testing

Through a simple blood test, genetic testing provides you with an understanding of your DNA and risk of inherited cancers, cardiovascular conditions and other disorders. With this knowledge, and guidance from your Cooper Clinic physician, you can take steps to protect your health.

Cancer-Related Genes

- 57 genes
- BRCA 1 and BRCA 2 for hereditary breast cancer risk
- Hereditary forms of colorectal, melanoma, gastric, ovarian, pancreatic, prostate, renal cell and thyroid cancers

Cardiovascular-Related Genes

- 75 genes
- Hereditary conditions of high cholesterol, arrhythmia, cardiomyopathy and abnormal blood clotting

Other Medically Important Genes

- 8 genes
- Hemochromatosis (a genetic condition that causes iron overload)
- Malignant hyperthermia (a genetic condition that causes the body temperature to increase above normal with anesthesia)
- Alpha-1-antitrypsin deficiency (a genetic disorder causing lung or liver disease)
